Downward solar flux over Massachusetts as daylight clock glyphs (07:00-19:00)

Synthetic data for 2025-07-15. Each dial spans 07:00 to 19:00, clockwise from the top, so daylight fills the circle; each spoke's length is the surface flux at that time, and the fan's shade is the whole day's integrated radiation. Coastal cells show morning marine stratus; the Berkshires cloud over in the afternoon.

Daily integrated downward shortwave flux (kWh/m²/day)

6.0 6.5 7.0 7.5 8.0 8.5 9.0

Grid: 63 cells, 20 km square, clipped to the state outline.
Time resolution: 30 min. Rim of every dial = 1000 W/m².
Dial spans 07:00 to 19:00 local; flux outside that window is not drawn but is included in the daily total.
Clear-sky curve from real solar geometry for the date; the cloud field, and therefore every flux value, is synthetic (seeded, reproducible).
